

Publishing and Sharing in Tableau **Assignment**

1. **What is the key difference between publishing a dashboard on Tableau Public versus Tableau Server/ Cloud in terms of accessibility and data security?**

Answer:

- **Tableau Public:** Dashboards are fully public and accessible to anyone on the internet. No data security—data is visible to all.
- **Tableau Server/Cloud:** Dashboards are secure and access-controlled, allowing only authorized users to view/interact based on permissions.

2. **When publishing a Tableau dashboard, what happens to a live connection compared to an extract? How does this affect data refresh and performance?**

Answer:

- **Live Connection:**

Connects directly to the data source in real time

Always shows up-to-date data

Performance depends on the source system and network speed

- **Extract:**

Creates a snapshot of data stored in Tableau

Requires scheduled/manual refresh

Faster performance since data is optimized and cached

- 3. In Tableau Server or Cloud (conceptually), which feature allows administrators to control which users can view, interact with, or edit a published dashboard?**

Answer: Permissions (User Roles & Permissions Rules) control who can view, interact, edit, or publish dashboards.

- 4. If you want users to view a dashboard but not download the underlying data, which permission setting would you adjust in Tableau Server?**

Answer: Adjust Permissions by disabling “Download Full Data” (and/or “Download Data”) for users or groups.

- 5. Name two methods by which a Tableau dashboard can be embedded into a web page or website.**

Answer:

1. Embed Code (iframe)
2. Tableau JavaScript API / Embedding API

- 6. List two best practices you should follow when preparing a dashboard for public sharing to ensure data security and privacy.**

Answer:

1. Remove or anonymize sensitive/confidential data
2. Use data extracts instead of live connections to avoid exposing source systems

7. After publishing a dashboard, users report a “Data not found” error. What is the most common cause related to data source settings?

Answer:

- The data source path is broken or inaccessible, often due to:
- Local file paths (e.g., Excel on desktop not uploaded)
- Missing credentials or incorrect connection settings

8. When embedding a Tableau dashboard into a secure internal portal, what two additional security measures should be implemented to ensure only authorized users can access the embedded content

Answer:

1. User Authentication (SSO, SAML, or Trusted Authentication)
2. Row-Level Security (RLS) or User Filters to restrict data visibility per user
